The invention relates to a compound targeted to a nucleic acid molecule encoding the human BRCA2 region transcription unit CGOD5 polypeptide. The compound is an antisense oligonucleotide that specifically hypridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2.0-methoyaehyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the human BRCA2 region transcription unit CGOD5 polypeptide and in preparation of a composition for treating hyperpolificative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
New compounds, particularly oligonucleotides targeted to a nucleic acid encoding BRCA2 region transcription unit CG005, useful for treating diseases hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3lutamine-fructose-6-phosphate amidotransferase; diabetes; ischemia;

                                                                                                                                                                                                                                                                                                                                                             X0000000000000000X0
                                                                                                                                                                                                                                                                ð
                                                                                                                                                  of GFAT. Specifically claimed are antisense oligonucleotides expression of GFAT. Specifically claimed are antisense oligonucleotides capable of modulating the expression of GFAT, and which comprise any of the 3063 sequences of 20 base pairs, given in the specification. The compound, composition and methods are useful for treating a disease or condition associated with GFAT, such as a disease or condition, e.g. diabetes, a cardiovascular or neurological disorder, ischemia/reperfusion injury. They are also useful in research and diagnostics for modulating the expression of GFAT. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2'-MCE wings and a deoxy gap, these oligonucleotides inhibit human GFAT expression.
                                                                                                                                                                                                                                                                                                                                                 ö

The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic sleet, lung, bone marrow or stem cell transplant rejection, accentation or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of
The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprise detecting the expression level of one or more genes. The methods, exptem and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, erg. heart, kidney, liver, pancreas, pancreatic individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonucleotide marker for diagnosis and monitoring callograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /*tag= b

methods are useful in diagnosing and treating hyperproliferative disorders e.g., cancer. The present sequence is an antisense oligonucleotide targeted to human fibrillarin DNA. This sequence is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage is e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylcytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rat; matrix metalloproteinase 11; MWP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents an antisense oligonucleotide targeted to DNA encoding the rat MMP11 polypeptide of the invention.
                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to a compound targeted to a nucleic acid molecule encoding a matrix metalloproteinase 11 (MMP11) polypeptide. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified uncleobase comprising a 5-methylytosine. The antisense compounds are useful for modulating the expression of the MMP11 polypeptide and in preparation of a composition for treating hyperproliferative disorders, e.g. cancer. This sequence represents a ret MMP11 DNA antisense
                                                                                                                                                     Rat; matrix metalloproteinase 11; MWP11; ss; antisense oligonucleotide; phosphorothioate linkage; 2'-0-methoxyethyl sugar moiety; 5-methylcytosine; hyperproliferative disorder; cancer; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonuclectide compound that inhibits expression of matrix metalloproteinase 11, useful for preparing a composition for treating hyperproliferative disorder, e.g., cancer.
                                                                                                                          Rat MMP11 DNA antisense oligonucleotide target region #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 20 BP; 2 A; 7 C; 9 G; 2 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide target region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 16; SEQ ID NO 230; 76pp; English.

The invention relates to a compound targeted to a nucleic acid molecule cenceding the human ATP-binding cassette subfamily C (ABCC2) polypeptide.

The compound is an antisense oligonuclectide that specifically hybridises with the mucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothicate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified sugar compounds are useful for modulating the expression of the human ABCC2 compounds are useful for modulating the expression of the human ABCC2 compounds and in preparation of a composition for treating disorders associated with ABCC2, such as diseases or conditions that affect drug clearance. This sequence represents so notitions that affect drug colearance. This sequence represents an antisense oligonucleotide targeted to human ABCC2 DNA of the invention.
                                                                                                                                                                                                                                                                                                                              New compounds, particularly oligonucleotides targeted to a nucleic acid encoding ATP-binding cassette C2 (ABCC2), useful for treating disease or condition that affects drug clearance.

The invention is useful for treating a disease or condition associated with Talin such as a disease or condition e.g. muscular, haematologic, cardiac or hyperproliferative disorder such as cancer. The present sequence is an antisense oilgonucleotide targeted to human Talin DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to novel antisense compounds targeted to a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding talin, useful for treating muscular, cardiac, hematologic, or hyperproliferative disorders.
/note= "Phosphorothioate backbone where all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antibody; immunoglobulin; antigen-specific lymphocyte; B-lymphocyte; T-lymphocyte; microwell chip; detection; isolation; selection; antigen-specific receptor; monoclonal antibody; T-cell receptor; immunotherapy; gene therapy; variable region; heavy chain; VH; PCR; primer; Ss.

The invention relates to a microwell array chip for detecting a single antigen-specific lymphocyte. Each microwell of the chip has the shape and size to accommodate one lymphocyte only. The lymphocyte may be a B or a T lymphocyte. The invention also relates to methods for detecting, isolating and selecting an antigen-specific lymphocyte, a method of cloning a gene encoding an antigen-specific lymphocyte is method of immunoglobulin or a T-cell receptor) from an antigen-specific lymphocyte via reverse transcription-PCR (RT-PCR); a method of manufacturing a monoclonal antibody using an antigen-specific immunoglobulin gene cloned using method of the invention; and a method of manufacturing gene therapy material using an antigen-specific T-cell receptor gene cloned using the cloning method. The method of the invention is useful for the efficient detection of a single antigen-specific lymphocyte, conced using the cloning method. The method of the invention is useful for the efficient detection of a single antigen-specific lymphocyte, conced using the cloning method. The method of the invention is useful for the efficient detection of a single antigen-specific lymphocyte, immunocherapy and gene therapy methods. Sequences ADP2118-ADP2133 crepresent PCR primers used to clone the heavy and light chain variable regions (ADP21234 and ADP21236) of an antibody produced by a single human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö,

The invention relates to a new compound targeted to a nucleic acid encoding MAD1-like 1 which specifically hybridises with the nucleic acid encoding MAD1-like 1 and inhibits expression of MAD1-like 1. The oligonuclectide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer. The present sequence represents a human MAD1-like 1 target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a new compound targeted to a nucleic acid encoding MAD1-like 1 which specifically hybridises with the nucleic acid encoding MAD1-like 1 and inhibits expression of MAD1-like 1. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer. The present sequence represents a human MAD1-like 1 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; human; antisense; MAD1-like 1; hyperproliferative disorder; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                           The invention describes histone deacetylase (HDAC) proteins OSHDAC1, OSHDAC2 and OSHDAC3 comprising amino acid sequences of 518, 498 and 510 amino acids having a function of histone deacetylase. Also described are: a gene coding for OSHDAC1 above or OSHDAC1 apove or OSHDAC1 gene coding for OSHDAC2 above or OSHDAC2 gene coding for OSHDAC2 above or OSHDAC3 gene coding for OSHDAC2 above comprising a sequence of SEQ ID NO: 1; a gene coding for OSHDAC3 above or OSHDAC3 gene coding for OSHDAC3 above or OSHDAC3 gene coding for OSHDAC3 comprising an amino acid sequence of SEQ ID. NO: 3; and a method for producing a plant having a high growth rate. The proteins are useful for developing a plant body which can be maintained at a high growth rate even under stress conditions. This sequence represents a primer used in the isolation of a rice histone deacetylase 3 (HDAC3) polynucleotide for use
                                                                                                                                                                                                                                      OSHDAC1, OSHDAC2 and OSHDAC3, can be maintained at a high

The invention relates to a compound targeted to a nucleic acid molecule encoding the human beta-site APP-cleaving enzyme 2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one office are useful for modulating the expression of the human beta-site APP-cleaving enzyme 2 polypeptide and for treating diseases associated with expression of beta-site APP-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer. This sequence represents an antisense oligonuclectide targeted to DNA encoding the human beta-site APP-cleaving

New antisense compound, useful for treating diseases associated with expression of beta-site amyloid precursor protein (APP)-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer.

Example 15; SEQ ID NO 96; 61pp; English.

The invention relates to a compound targeted to a nucleic acid molecule encoding the human beta-site APP-cleaving enzyme 2 polypeptide. The compound is an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonucleotide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-0-methoxyethyl sugar moiety, or at least one modified are useful for modulating the expression of the human beta-site APP-cleaving enzyme 2 polypeptide and for treating diseases associated with expression of beta-site APP-cleaving enzyme 2 such as sporadic inclusion-body myositis and cancer. This sequence represents a human beta -site APP-cleaving enzyme 2 DNA antisense oligonucleotide target region of the invention.

```

The invention relates to a novel method for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The method comprises modifying the alleles of a gene in diploid fungal cells by recombination using a gene disruption cassette and a promoter collection of diploid fungal cells each of which comprises modified alleles of a different gene; a strain of diploid fungal cells comprises collection of diploid fungal cells each of which comprises modified alleles of a gene, where the first allele of the gene is inactivated by a gene disruption cassette comprising a nuclectide condition and encoding an expressible selectable marker; and the expression of the second allele of the gene is regulated by a heterologus promoter that is operably linked to the coding region of the second allele of the gene is regulated by a heterologus promoter that is operably linked to the coding region of the second allele of the gene is result of the second allele of the gene is resulted by a heterologus promoter collection of diploid fungal strains comprising the diploid fungal strains condition and are present in different diploid strains cit amolecules, where each nucleic acid molecule comprises a nucleic acid molecules sequence that is hybridizable to a target nucleotide sequence that is hybridizable to a target nucleotide sequence comprising any of the 310 nucleotide sequences listed in the specification (App9816-App98825); identifying a gene that is essential contributes to the virulence and/or pathogenicity of a fungus, or that contributes to the virulence and/or pathogenicity of a fungus, or that contributes to the virulence of and/or pathogenicity of a fungus, or that contributes to the registance of the diploid fungus and antifungal agent; identifying an antifungal Claim 36; SEQ ID NO 4148; 163pp; English. replacement fragment.

agent that inhibits the growth of a diploid fungue, or a therapeutic agent to treatment of a mammalian disease; correlating changes in the levels of proteins or gene transcripts with the inhibition of growth or levels of proteins or gene transcripts with the inhibition of growth or proliferation of a diploid fungal cell; a purified or isolated uncleic comprising a nucleotide sequence encoding a gene product required for proliferation of Candida albicans, where the gene product consisting a promoter operably linked to the nucleic acid molecule cited above; a host cell containing the vector; a purified or isolated above; a host cell containing the vector; a purified or isolated above; a host cell containing the vector; a purified or isolated above; a properied fused to a second polypeptide, the fragment of a first polypeptide fused to a second polypeptide, the fragment of a first polypeptide security of a gene product encoded by a nucleic acid computising any of App98915. App98915; electing an immune response in an animal; a strain of activity of a gene product encoded by a nucleic acid compisising any of App9915. App98915; electing an infaction of a neterologous promoter; identifying a compound or binding protein proliferation of candida ablicans; inhibiting growth or proliferation of candida ablicans; inhibiting growth or proliferation of candida ablicans; inhibiting ontain an original albicans and the accordant or proliferation of any object by Candida ablicans; preventing or containing ontimiting formation of an object by Candida ablicans, preventing or containing ontimiting formation of an object by Candida ablicans, preventing or containing containing containing accordant or proliferation of any object by Candida ablicans; preventing or containing containing companies and original comprising and product encoded by any object by compound against a target gene product encoded by any object by compound against a target gene product encoded by any object. App98915; identifying a putatively and appended or a fun ö collecting identified essential genes. This polynucleotide sequence represents an identification primer used in the exemplification of the invention. NOTE: This sequence was downloaded from an electronic sequence listing provided on the WIPO website. ```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or masal airway dysfunction and a second active agent comprising an anticinal ammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or therapeutic respiratory effect of an autiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or creeptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or fitp. wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and

Claim 15; SEQ ID NO 4652; 763pp; English.

bronchodilating agent.

```
This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of atarget polypeptide associated with lung airway or lung expression of atarget polypeptide associated with lung airway or lung conferencions for adding a carrier and for use of the kit. The composition of the invention as antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The culture and seasoes or conditions and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction, and/or bronchoconstriction and and associated configuration, allergies, asthma, impeded respiration, respiratory disease, pulmonary configures syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary configuration rejection, pulmonary infections, burchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the configure into the argument of the parence of prevent the bronchities or cancer. The inflammation rejection, pulmoray prevented the reduced adenosine content of the anti-sense oligos corresponding to the promine into the prevented and promine into the prevented and promine and prevented and promine and promine and promine an

| Sequence 2, Application US/09198243
| Patent No. 618399
| GENERAL INFORMATION:
| APPLICANT: WITHER, Thomas
| APPLICANT: GROENER, Albrecht
| TITLE OF INVENTION: Procedure for the detection of high virus
| TITLE OF INVENTION: concentrations in blood plasma and/or blood serum by
| TITLE OF INVENTION: means of the polymerase chain reaction
| TITLE OF INVENTION: means of the polymerase chain reaction
| TITLE OF INVENTION: means of 1998, 243
| TITLE OF INVENTION: 1998-11-24
| CURRENT APPLICATION NUMBER: VS/09/198, 243
| CURRENT FILING DATE: 1998-11-24
| MUMBER OF SEQ ID NOS: 3
| SOGTWARE: PatentIn Ver. 2.0
| SEQ ID NO 2
